Mastercard Tokenisation

Card-on-file convenience meets crypto-level card security.

Customers love the convenience of having their cards saved on file for recurring purchases. And they also expect their payment details to be kept secure from online fraudsters.

Introducing Mastercard Tokenisation for Merchants

Here's how it works

When a customer enters their card details, they're immediately replaced with a Mastercard token.

The Mastercard token is unique to both the customer and your business.

When a customer then makes a payment, the token is transmitted – not the card details.

If a customer's card details ever change, the new details are automatically mapped to the Mastercard token.

This reduces preventable declined transactions and ensures continuity of your customer's payments.
